

Restoration of a section on the Ulf Stream (Be)

The purpose of the project was to restore a channelized section of river to improve the habitats for fish, as an important source of food for otter (European Life project).

The river works consist to rebuild a new river in an old meander, adding some specific fish habitats like LWD and some stones (providing cover) and specific plants.

The design was a mix of feature and process based approach project, with expected result such as natural habitat created by the river itself (flooding).
