

Films of local and foreign rivers

Within the Stream And River Consult team, Philippe Laforge, hydrobiologist, produces films to collect and share knowledge on rivers and their biodiversity.

The recording of sequences involves long observations of the watercourse and helps to refine knowledge of the aquatic environment and its renaturation techniques, as shown by these images taken as part of a partnership within the United States (Confluence inc.).

In addition, his films can be used to document the state of a watercourse during the diagnosis phase and then after restoration work. Underwater footage helps to monitor the effectiveness of natural and artificial fish shelters.
